Assignment question::

Using PIR sensor and tmp36(Temperature sensor), piezo alarm, please create a circuit with Arduino Uno with below functionalities.

1. Alarm should give one sound when there is a motion near PIR sensor
2. Alarm should sound with different sound when the temperature is above 60 degrees.

Arduino code :

```
float temp; int
Buzz=A2;    int
sensor=12;  int
transistor=2;
void setup()
{
    Serial.begin(9600);
    pinMode(2,INPUT);
    pinMode(12,OUTPUT);
    Serial.println("waiting for motion");

}
void loop()
{
    double data=analogRead(A2);
    double n=data/1024;

    double vout=n*5;
```

```

double off=vout-0.5;

double temperature=off*100;

Serial.print("Temperature data: ");

Serial.println(temperature);

    if(temp>60)
    {
        digitalWrite(Buzz,HIGH);
        Serial.println("temperature detected");
        tone(12,100); delay(1000);
        tone(12,200); delay(1000);
    }
    int val = digitalRead(2);
    if(val ==HIGH)
    {
        digitalWrite(transistor, HIGH); Serial.println("Motion
        Detected"); tone(12,100); //pin number, frequency,
        delay(optional) delay(1000); tone(12,200); delay(1000);
    }
    if(temp <= 60)
    {
        digitalWrite(Buzz,LOW);
        Serial.println("No temperature
        detected"); noTone(12); delay(500);
    }
    if(val == LOW)
    {
        digitalWrite(transistor,
        LOW); Serial.println("NO

```

```

Motion"); noTone(12);

delay(500);

}

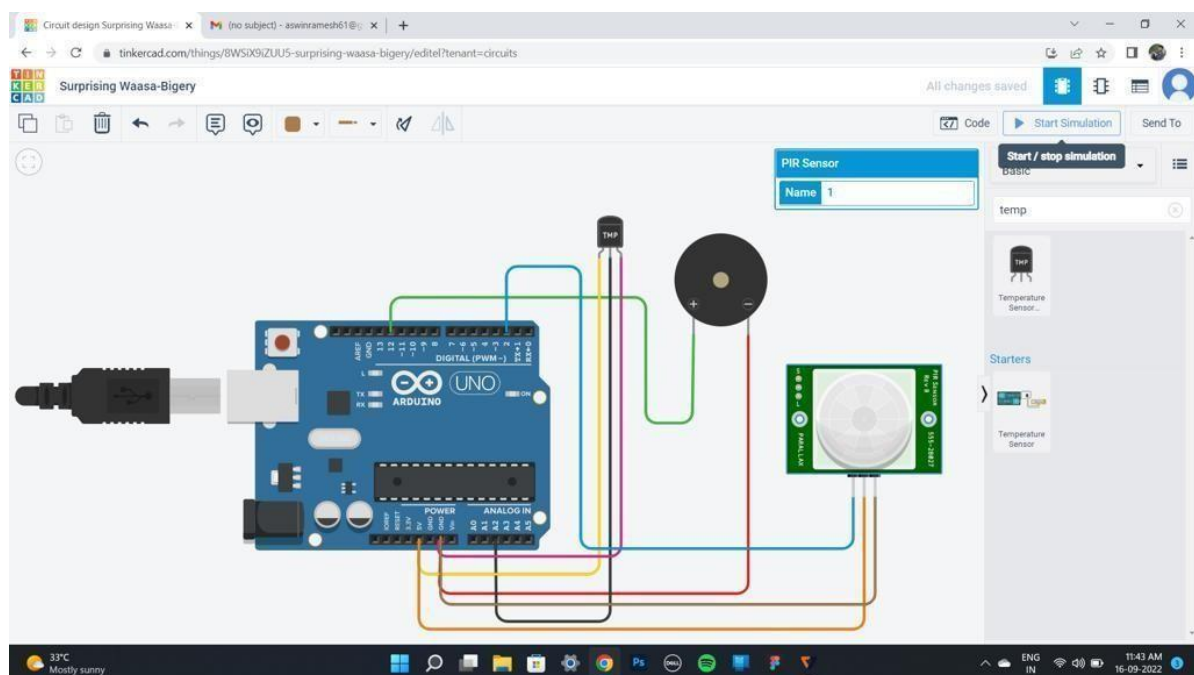

delay(1000);

}

```
